

Make Vaccine Scheduling Easier for Your Patients

If you happen to not administer all vaccines within your clinic setting and frequently refer patients to local pharmacies for such services, a new scheduling tool is available to make the process easy for them.

[EasyVax](#) is an online scheduling tool that allows patients to select what vaccines they are in need of receiving, after which it then directs them to local pharmacies that have them in stock and available for administration. Depending on the scenario, multiple pharmacies may be listed for a patient to choose from depending on the location that they indicated in the search function. In some cases, specific appointment times at specific pharmacies will be immediately listed, making the selection process easy for patients to choose what is most convenient for their situation. In other cases, the patient may need to click a pharmacy's website link to be directed to their individual scheduling platform.

When going through the vaccine search and scheduling process, patients can schedule more than one vaccine all within the same appointment. At the time of this article, the following immunizations were available to search and schedule:

- COVID-19
- Flu
- Pneumococcal
- RSV
- Shingles
- Tdap

In addition to being offered as a website, *EasyVax* is available through app stores in both English and Spanish, allowing this system to be used both via computers and smart phones. We tested the process during the writing of this article and it seems to have the potential to be a great resource for patients all while helping to break down barriers to receiving the immunizations patients need for optimal health.
